Lab 9: Initial setup

Advanced Networks (420-521-VA)

Instructor: Tiago Bortoletto Vaz
Fall 2026

General instructions

Your team will have about two hours to start populating their git repository. You will also decide and if possible start the installation of the software in the machines that will run them. If your project require specific hardware, you should identify it now and give me the exact model and quantity. If your topic needs a machine on the Internet, please setup now a server, then start and document your setup.
The PDF you hand in is a record of what you did during these two hours, not a description of what you plan to do later. Anything not yet installed, bought, or running goes in the "still open" section, not in the tables. I may ask any member of the team to show me the server, or the command output, so write down only what you can actually show. Submit one PDF per team on Omnivox before the end of the period, with the repository URL on the first page.

Proposed workflow

Take a few minutes to split the work: one person creates the repository, another handles the server or do the plans about the hardware order, a third installs software and records versions, etc. Then spend about 1 hour doing the practical work, whether that means renting the VPS, setting up and testing the hardware, or experimenting with the software you will depend on. Take notes and screenshots as you go, because the commands, addresses, model numbers, prices, and failures are exactly what the PDF needs. Keep the last half hour to write the PDF from those notes, push to the repository, and submit.

The repository

Create a GitHub repository today and give every team member write access. It can be public or private; if private, add myself (tiagovaz) as a read-only member. Organize it as if someone else might have to pick it up and run it:

- `README.md`: title, names and student IDs, topic, a paragraph on what you are building, how to reproduce your setup, and the address of any live host.
- `LICENSE`: a real license such as MIT or GPL, named in the README.
- `slides/`: the presentation. A title slide in PDF is enough for today.
- `src/`: code and scripts, or a short `README.md` saying what will go there.
- `config/`: the configuration files you wrote today, with secrets removed.
- `docs/report/`: the final report, started today with the content of this design.
- `docs/plan/`: your original Lab 7 plan and the document you are writing now.

- `evidence/`: screenshots, notes and command output.

Passwords, private keys, and community strings never go into the repository or the PDF. Public keys, public addresses, and redacted example configurations are fine.

The PDF

Three to four pages, using tables wherever a table fits, in this order:

1. A cover with the project title, names and IDs, topic, repository URL, and date.
2. Hardware, one row per device: type, manufacturer, model, quantity, who owns it or where it was ordered, and its status today: in hand and powered on, ordered, or dropped. "A laptop" or "a Raspberry Pi" is not an exact model, please be precise.
3. Hosting, if you rented a machine: provider, plan and price, datacenter location, operating system image, public IPv4 and IPv6, the account you connect as over SSH, and the output of `ss -lnt`. If your topic needs no server, say so in one line and name the machine the work runs on.
4. Software, one row per program installed today: name, version, the command that showed the version, and its role in the project. Nothing that is not installed belongs here. Below the table, one line on what you dropped from the Lab 7 plan and why.
5. What ran today: command output and screenshots, and two or three sentences on what you observed.
6. Who did what today. Each member will write their own sentence.
7. Who does what from now until the presentation.

Before you submit

Check that the repository URL opens and that I am a collaborator if it is private. Make sure the software table matches what is installed, every hardware row has a model number, and the server, if you need one, has an address you read off the machine today. Confirm that no secret made its way into the repository or the PDF, and be ready to show me any of it before submitting it.
